Applicable Urban Design Priorities Project Should Achieve

- [1] Understanding site specific restraints, maximizing the built edge along Mockingbird is encouraged - Constraints such as access drives and easements challenge a continuous built edge along Mockingbird. Wherever possible, buildings along mockingbird should be sited to reinforce a built edge along the street.
- [2] Surface parking should incorporate trees at a regular intervals **throughout** - It is encouraged that large surface parking areas incorporate a regular pattern of trees throughout as a means of softening the parking field and providing shade.
- [3] The high volume of impervious surface provides an excellent opportunity to incorporate integrated storm water management techniques throughout the parking and overall site hardscape and landscape - It is highly encouraged that landscaping is designed to mitigate storm water while exploring opportunities to incorporate existing trees and vegetated areas into overall storm water management

TIF Urban Design Guidelines Part III, Part IV [Maple/Mockingbird]

Context Description

The site is located west of Love Field along Mockingbird Lane. The development proposes small retail leases along Mockingbird with larger leases in the rear of the phase 1 site. The phase 2 site is planned as multifamily residential units with structured parking.

This review will be in regard to the phase 1 retail site. The phase 2 residential site is included as context information but will not be reviewed at this time.

Mockingbird lane is currently dominated by a highly auto-centric development pattern. Considerations for this proposal are centered around shifting from typical pad site development pattern toward a more walkable urban street edge along Mockingbird and the proposed central drive.
